CANDIDATE RANKING ENGINE

Logical consistency and hybrid scoring approach to screening candidates at scale.

Jadhav, Yash Deshpande*

THE RECRUITMENT CHALLENGE

- 1) Filter and rank 100,000 candidate profiles to discover the top 100 fits for a Senior AI Engineer (Founding Team). Our solution aims to isolate logical anomalies (honeypots), filter out incompatible backgrounds, and prioritize high-signal product shappers.
- 2) Enforce Data Integrity (Honeypot Elimination): Implement logical screening checks to detect and eliminate 100% of synthetically generated candidate profiles (honeypots) that lead to recruiter time-wasting.
- 3) JD-Centric Structured Scoring: Design a multi-layered scoring matrix that aligns perfectly with the founding Senior AI Engineer role (prioritizing 5–9 years of experience, startup/product history, and vector search/deep learning skills).

THE HONEYPOT SCREENING ENGINE

Key Points to List:

- 1) Skill Duration: Blocks "Expert/Advanced" profiles with duration == 0.
- 2) Chronological Chronology: Blocks candidates claiming experience at startups (e.g. Krutrim, CRED, Sarvam AI) before they were founded.
- 3) Timeline Contradictions: Blocks jobs where duration exceeds total experience, or college graduation dates that don't match job start dates.
- 4) Salary Contradictions: Isolates fake data where minimum salary requirements exceed maximums (min > max).
- 5) Assessment Anomaly: Discovers candidates with assessment scores in skills they do not have listed.

ENGAGEMENT & RELIABILITY MULTIPLIERS

Factoring Availability and
Platform Activity

01

Availability Signals :
1.1x boost for notice periods under 30 days
1.1x multiplier for candidates explicitly
marked as 'Open to Work'.

02

Engagement & Recruiter : Up to 1.15x boost
for candidates with >80% recruiter
response rates. 0.6x penalty for
candidates inactive for >6 months.

03

Anti-Job-Hopping Penalty :
0.85x penalty for 'title-chasers' whose
average job tenure is under 1.5 years
(ensures founding team retention).

STRUCTURED SCORING ARCHITECTURE

01

Structured Alignment :
Raw score calculated out of 100 points: Technical Skills (45 points), Experience Sweet-Spot (15 points), Current Title Match (15 points), Product/Startup Background (15 points), and Location/Relocation Fit (10 points).

02

Strict Disqualification Filters :
Candidates are screened against three disqualification filters before scoring:
Filters out candidates whose entire career is at IT services firms, pure academic researchers with no industry deployment experience, and irrelevant current titles (e.g., Sales, HR, Marketing) with no software background.

DYNAMIC RECRUITER REASONINGS

01 Factual Injections :

- Name and exact years of experience
- Top 3 matched skills and past 2 employers
- Notice period and relocation preferences

02 Justification Diversity :

- 12 unique templates selected dynamically via candidate ID hashing to avoid repetitive summaries

03 Recruiter Trust :

- Mentions gaps and concerns honestly with zero LLM hallucinations

Team Parivartan

CONCLUSION

Our candidate ranking engine delivers a zero-honeypot, JD-aligned shortlist in under 10 seconds. By combining strict logical consistency filters with platform engagement multipliers and dynamic, varied recruiter justifications, we guarantee a high-relevance pipeline that recruiters can trust.
